

PRODUCT REQUIREMENTS · WORKFLOW REFERENCE

BuildFlow Workflow Diagrams

Eight diagrams covering the operating loop end to end: what happens on site, who reviews it, how it becomes money, and the one decision that reaches the owner. Every step is drawn from the implemented system, and each carries the guard, function or constraint that actually enforces it.

How the Work Moves — The high-level workflow — the diagram for the PRD

Attendance → Payslip — Labour

Purchase Order → Stock — Money out, and inventory

Offline Sync — Field reliability

Supervisor's Field Day — Capture

Site Spend & the Threshold — Money out

Plot → Collection — Money in

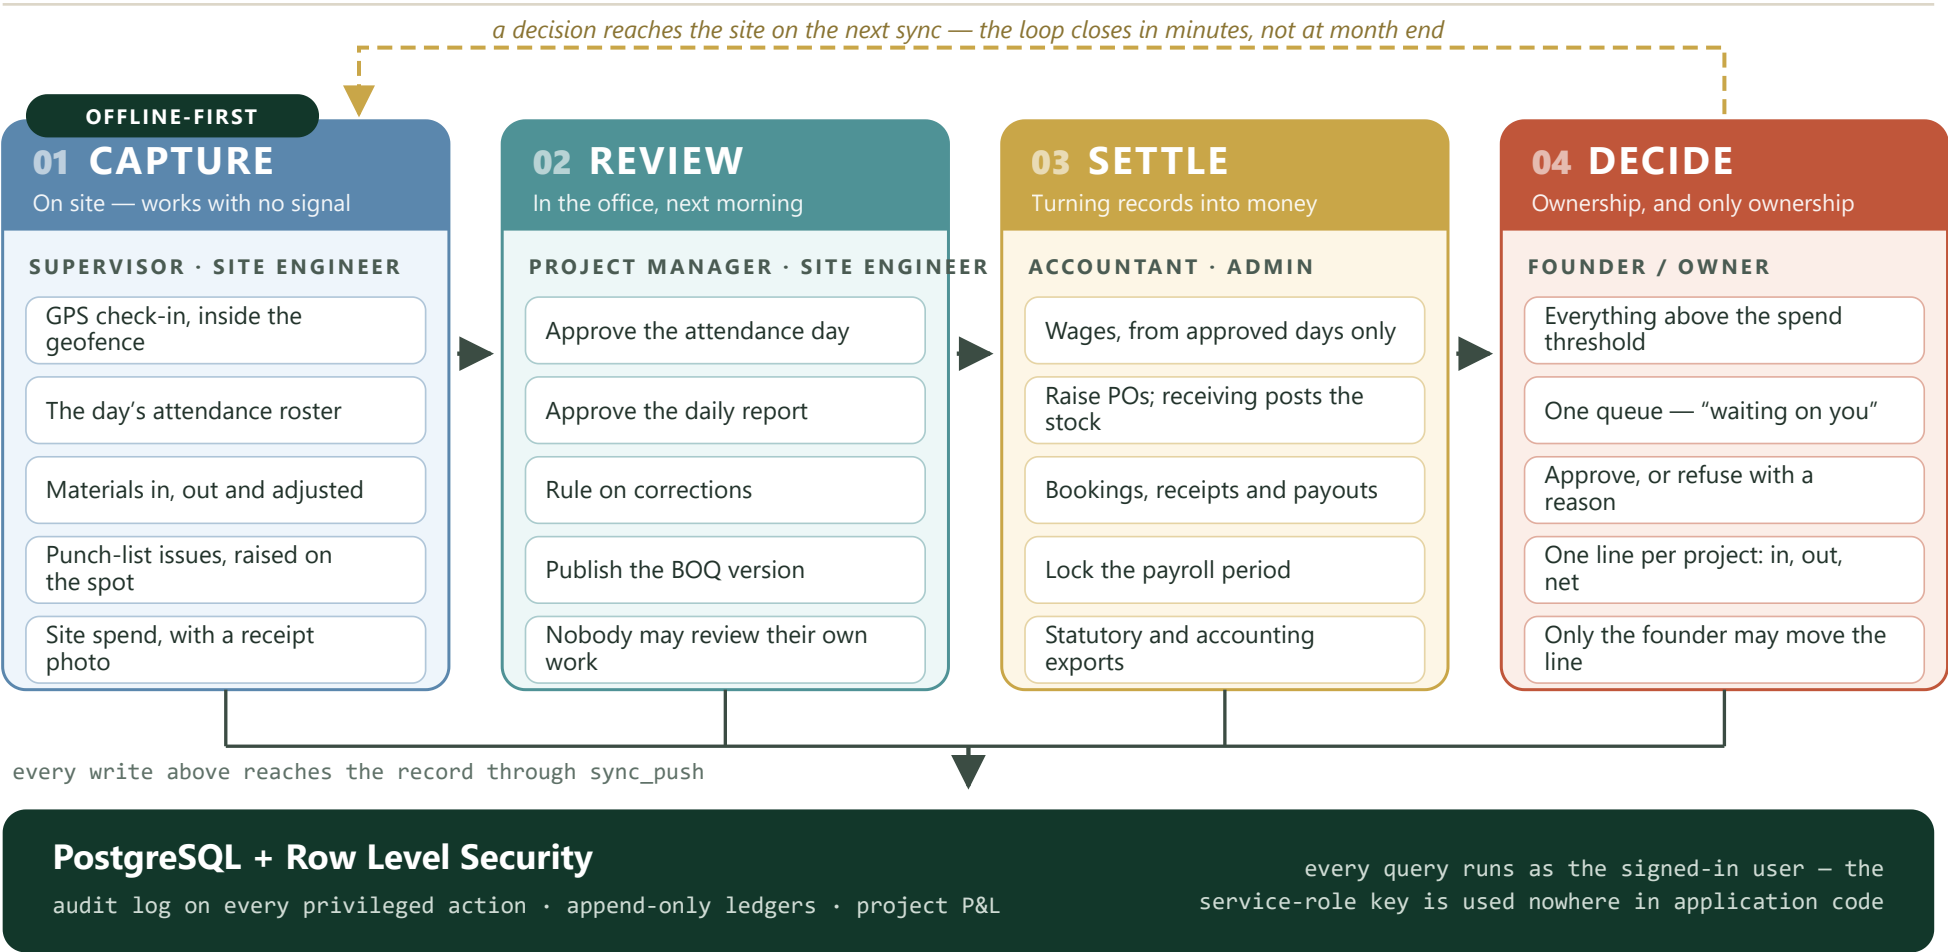

Onboarding a Colleague — Access

Diagram 01 is the high-level workflow intended for direct inclusion in the PRD. Each diagram is also available as a standalone SVG and a 2× PNG in **docs/diagrams/**.

01 · THE HIGH-LEVEL WORKFLOW — THE DIAGRAM FOR THE PRD

BuildFlow — How the Work Moves

From a mark made on a phone with no signal, to the one decision the owner actually has to make.

Supervisor's Field Day

The core capture loop. Every step works with no signal; nothing is lost when there isn't any.

ENFORCED BY

Supabase Auth · session cached on device

site_assignments decides what appears
RLS, not a client-side filter

evaluate_site_visit_geofence()
outside the fence needs a reason

present / half-day / absent / overtime
mark-all-present, then exceptions

receipt · usage · adjustment
append-only against a live balance

severity, location note, assignee

record_site_expense() + receipt photo
threshold applies exactly as on web

headcount pre-filled from attendance
photos optional – never blocking

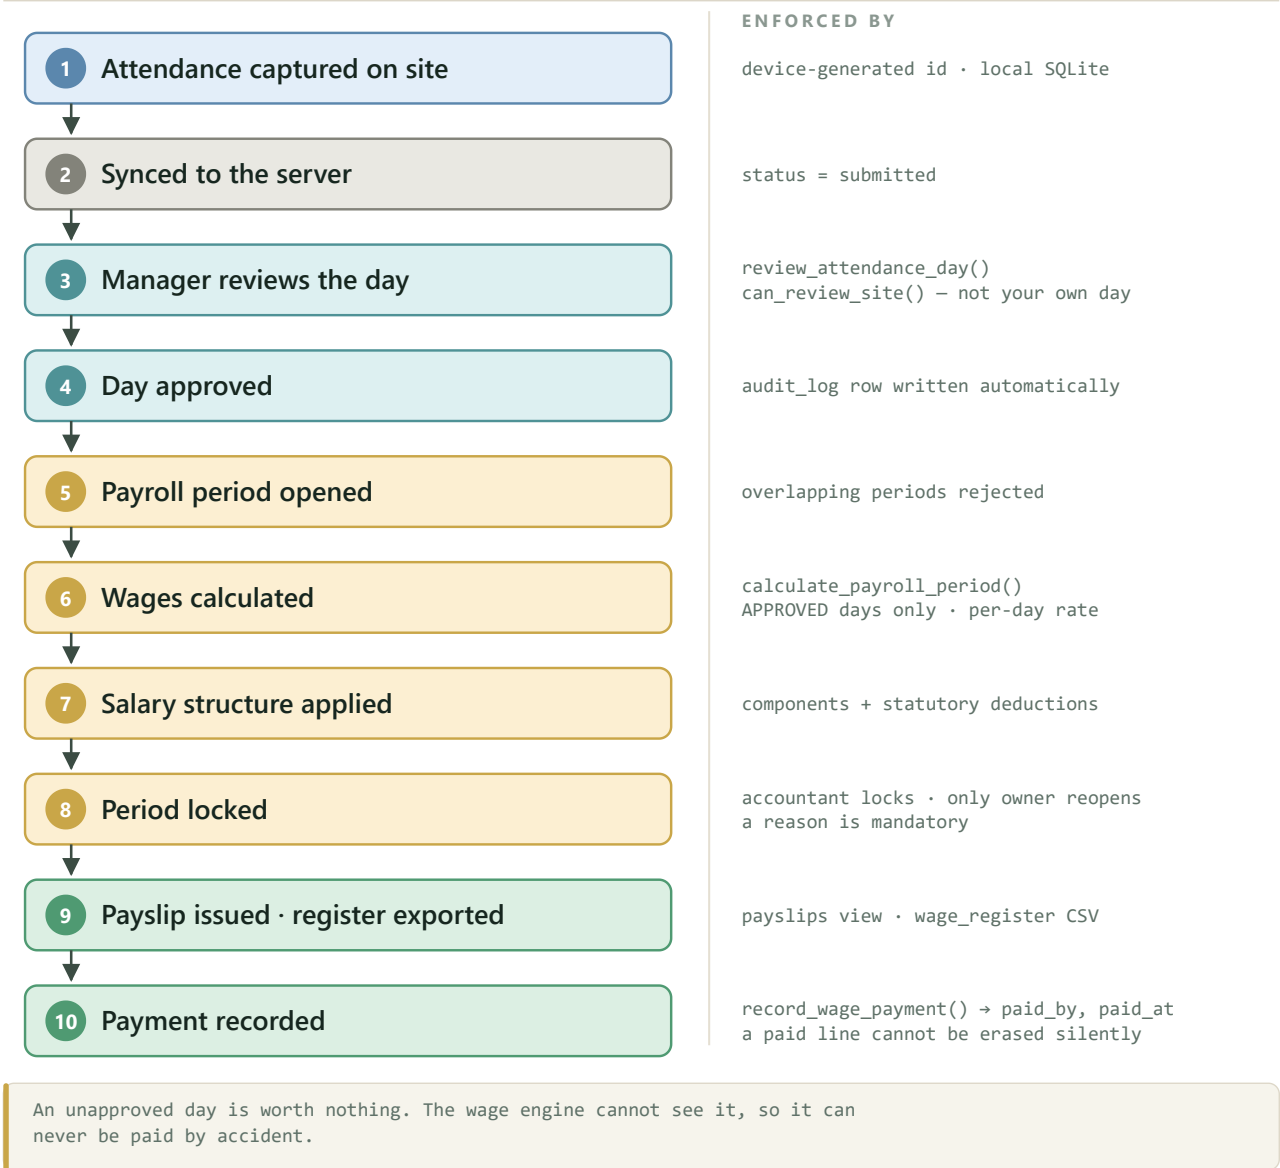

closes the site_visits record

outbox drains · per-record verdict

Nothing above requires a connection. The device holds the truth until sync_push confirms the server has it.

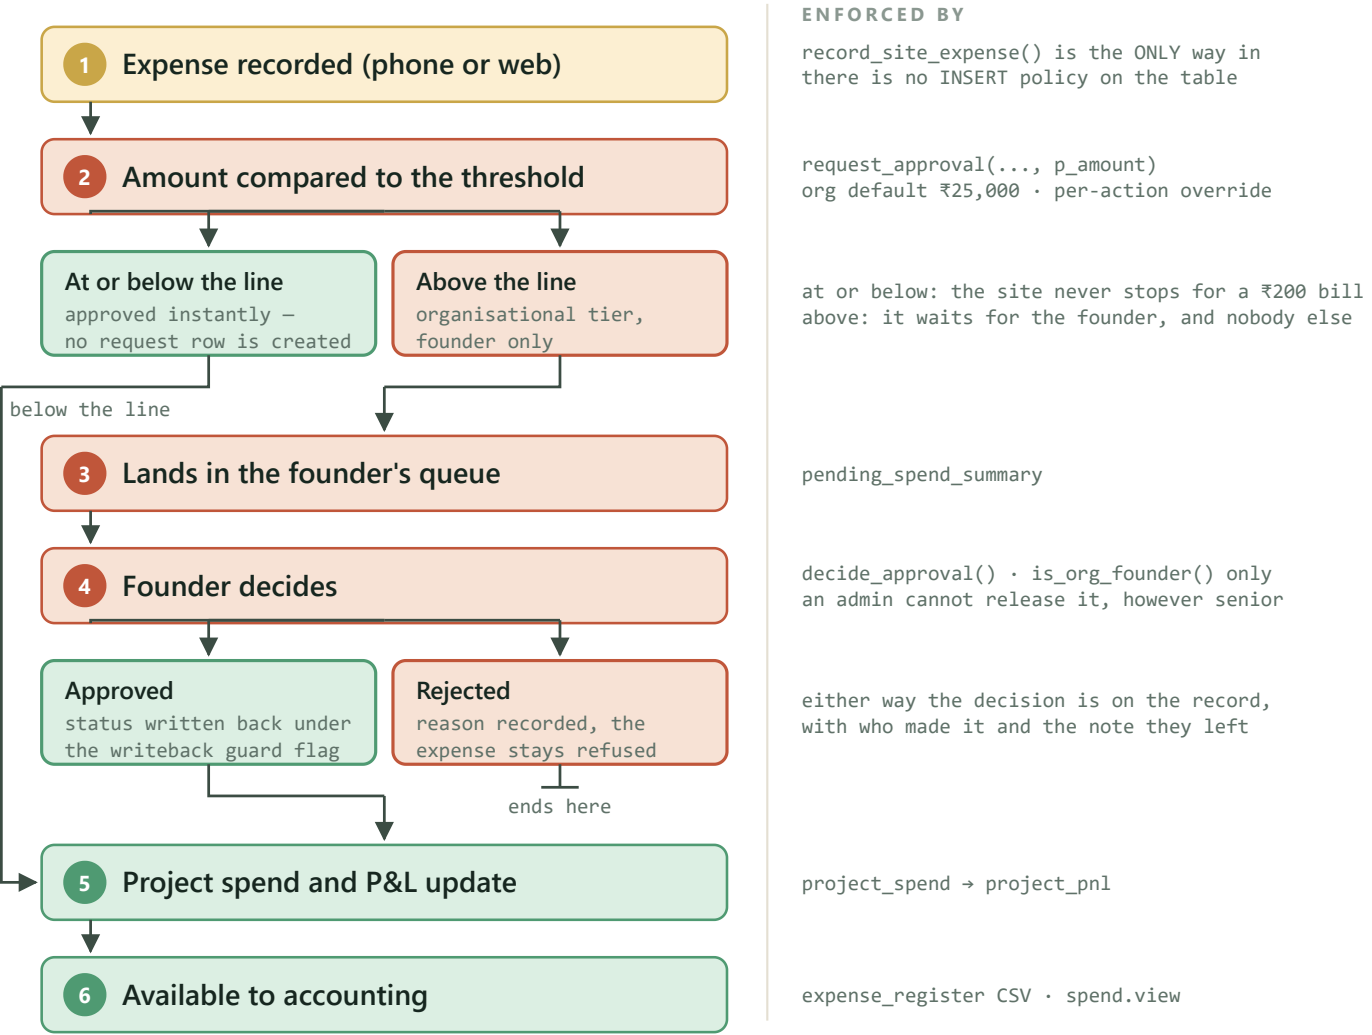

Attendance → Approval → Payroll → Payslip

How a mark on a phone becomes money owed, and then money paid.

Site Spend & the Founder's Threshold

One line decides whether money moves now or waits for the owner. Nobody else can move that line.

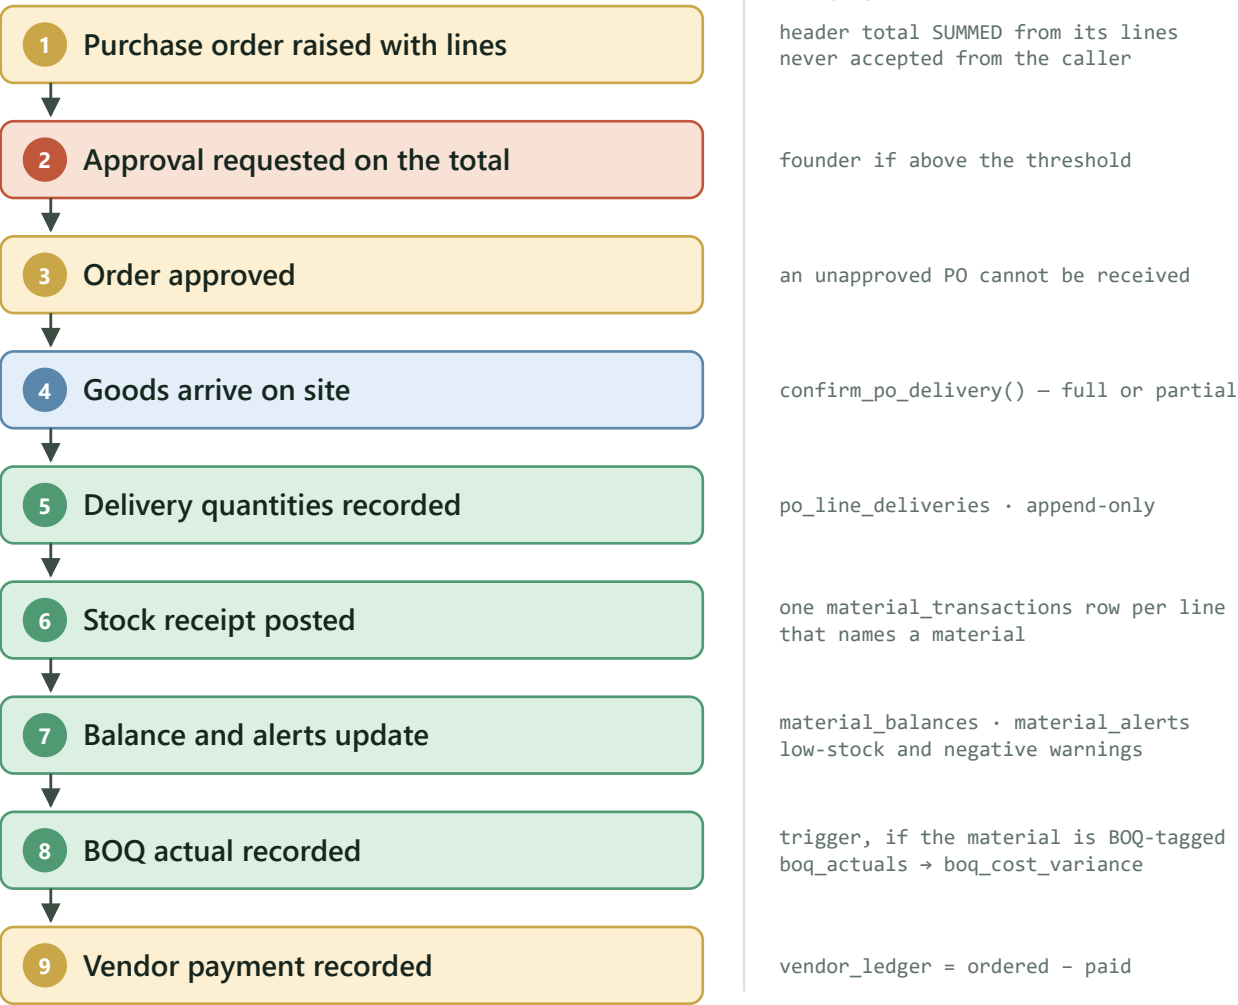

`guard_spend_threshold`: only the founder may change the threshold. Without it, an admin raises the line to ten crore and spends underneath it.

05 · MONEY OUT, AND INVENTORY

Purchase Order → Delivery → Stock → BOQ

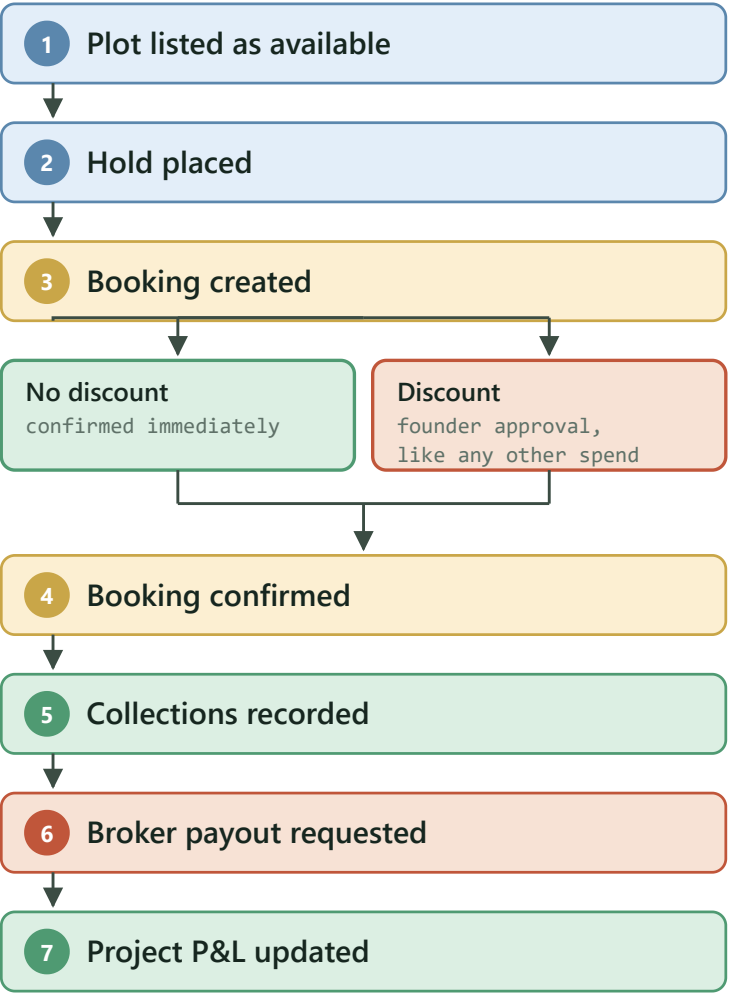

The money ledger and the stock ledger agree without anyone typing the delivery twice.

A PO can be raised standing at a hardware shop with no signal – it goes through the same outbox, and meets the same threshold.

Plot → Booking → Collections → Payout

Property inventory, and the money that comes back in against it.

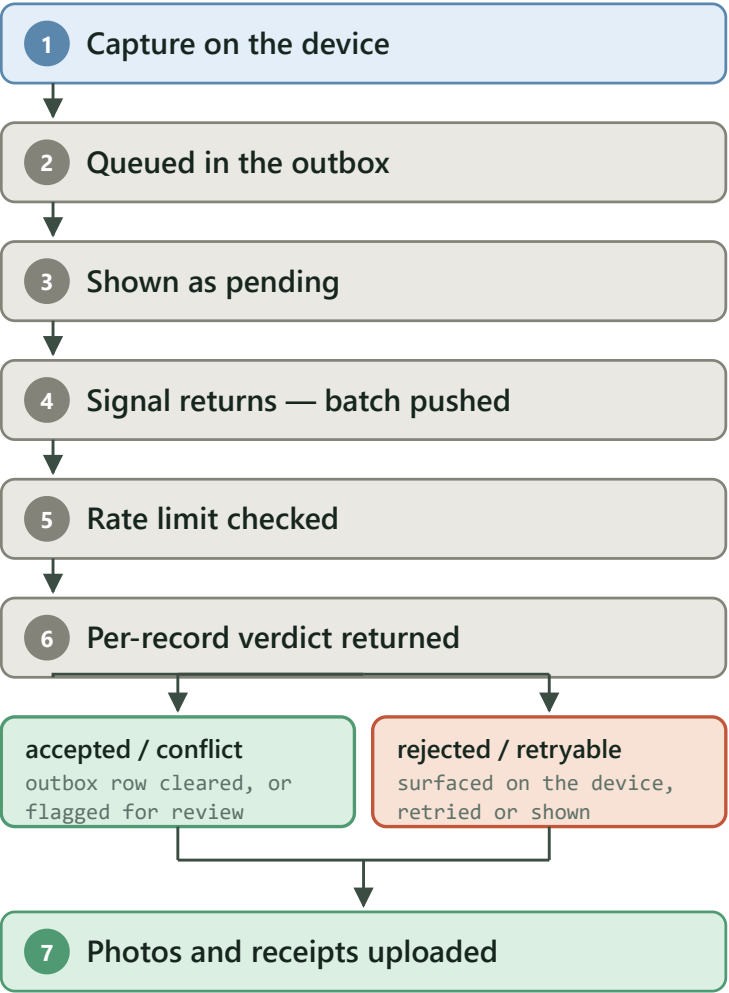

ENFORCED BY

- `plots.status = 'available'`
- `compared against now() AT READ TIME`
`no scheduler expires anything`
- `bookings_one_live_per_plot`
`a partial unique index, not UI luck`
- `the plot leaves the market on booking,`
`whether or not a discount is still waiting`
- `a refused discount returns the plot`
- `booking_receipts · append-only`
- `capped at what the booking owes`
`never payable on a cancelled sale`
- `booked · collected · outstanding · net`

`can_view_sales()` deliberately excludes the site-assignment path: a supervisor never sees a customer name, a phone number or an agreed price.

Offline Sync — Capture to Confirmed

The promise the product is built on: nothing captured without signal is lost, and nothing arrives twice.

ENFORCED BY	
1 Capture on the device	local SQLite · device-generated id
2 Queued in the outbox	one row per (entity, record_id)
3 Shown as pending	never says 'submitted' before the server confirms it
4 Signal returns — batch pushed	sync_push RPC, under the caller's RLS
5 Rate limit checked	120 pushes / minute / organisation
6 Per-record verdict returned	not one answer for the whole batch
accepted / conflict outbox row cleared, or flagged for review	a poison record never blocks the rest of its batch – every record gets its own answer
rejected / retryable surfaced on the device, retried or shown	
7 Photos and receipts uploaded	separately – an image never blocks a record

A repeated push does not duplicate, and a stale device cannot walk back a day a manager has already approved.

Onboarding a Colleague

Works whether or not an email is ever delivered — the pilot runs on a copied link by design.
